# Storyboard

Involves creating a series of illustrated panels that visually represent each shot and scene in the script.

Storyboards help in visualizing the sequence of events, framing, and composition of shots before filming begins.

Pre-visualization tool is used to plan and visualize the sequence of shots, timing, and pacing of a project before full animation production begins.

It's essentially a rough draft created using storyboards or storyboard sketches, along with shots in 2D animation to determine timing, temporary sound effects, dialogue, and music.

This is also used as a reference for the animators, it does not show how the final product would look.
